-:- SCBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELORE CONSISTS OF TWO PROTEINS:
PROTEIN AND GIYCOPROTEIN B. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

FROTEIN C AND MRNA (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                     The present invention relates to hepatitis C virus (ECV) core antiger and NS (nonstructural) 3/4a antibody combination assay that can detect both HCV antigens and antibody especin in a sample using a single solid matrix as well as immunoassay solid supports for use in the assay. The solid support is useful for detecting HCV infection in a biological sample. The present sequence is HCV-1 NS3/4a mutant conformational antigen. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatitis C virus: HCV: NS3/4a conformational epitope; seroconversion; immunoassay solid support; multiple epitope fusion antigen; MEFA; non-structural protein; mutant; mutein.

```
The present invention relates to a new immunoassay solid support

consisting essentially of at least one hepatitis C virus (HCV) NS3/4a

conformational epitope and a multiple epitope fusion antique. (MEPA).

bound to the support. The NS3/4a conformational epitope and/or

MEPA reacts specifically with anti-HCV antibodies present in a biological

sample from an HCV-intected individual. The immunoassay of the invention

is useful for defecting hepatitis C virus infection in a biological

sample. The method of the invention provides a sensitive, accurate

diagnostic and progressic tool to provide adequate patient care and to

prevent transmission of uro by blood and by blood products, or by

personal contact. Use of NS3/4a conformational epitope in combination

with MEPA, provides a sensitive and reliable method for detecting early

SC seroconversion. Use of MEPA has the added advantages of decreasing

masking problems, improving sensitivity in detecting antibodies by

substrate, and improving substrate. Detection accuracy is increased and

the incidence of false results is reduced because of the identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 GTRTIASPKGPVIQMYINVDKDLVGWPAPQGSRSLTPCTCGSSDLYLVTRHADVIPVRRR 120

The present invention relates to immunoassays comprising Hepatitis 2 Virus (HCV) NS34a conformational epitope and multiple epitope [usion antigen (MEFA), bound to a solid support. The NS3/4a epitope and/or the miltiple epitope fusion antigen react with anti-HCV antibolies present in a biological sample from an HCV-infected individual. The immunoassays and methods of the invention are useful for detecting HCV infection in a biological sample. The inventior are useful or detecting early HCV seroconversion. The assays can defect HCV infection anased by any CK seroconversion. The assays can defect HCV infection caused by any contains decreases masking problems, improves sensitivity in detecting antibodies by allowing a greater number of opiopes on a unit area of substrate, and improves selectivity. The present sequence represents HCV type 1 (9CV-1) NS3/4a conformational antidee, a mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunoassay solid support for detecting Hepatitis C Virus infection in
biological samples, comprises Hepatitis C Virus conformational epitope
and multiple epitope fusion antigen
                                                                                                                                                            "Corresponds to amino acid residues 1027-1711 of HCV-1 NS3/4a polypoptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Coit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               KNA was isolated from the plasma of a HCV scropositive human (designated "IG") and cDNA was prepared from it. The CDNA was PCR amplified using specific primers with sequences based on the prototype HCV-1 CDNA sequence (GENBANK M6232). Further amplification using nested primers resulted in 7 adjacent HCV DNA fragments which could be assembled into a full-length sequence. The DNA sequence was determined and translated into the genomic amino acid sequence.
                                                                                                                                                                                                                                                                      HCV genomic amino ucid sequence isolated from infected human LG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New plasmid pHCV-162 is a mammailan expression systems for HCVD proteins - useful for diagnosing HCV infection and as vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 944; DB 14; Length 3011;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is the peptide encoded by the composite hepatitis C virus (HCV) CDNA of AAN90331. The polypeptides are used to diagnose HCV induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatitis C virus qune - used for produ. of polynucleotide probes, polypeptide(s) and antibodies for diagnosis, prevention and

These antigens react with antibodies in patients with non-A non-B hepatitis (NANBH). They can be used to diagnose HCV-induced NANBH, to raiso antibodies for immunoassay or treatment, or to produce vaccines. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus gene - used for prodn. Of polymolectide probes, polymeptide(s) and antibodies for diagnosis, prevention and treatment of infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gabs

```
It is the sequence encoded in the open reading frame of hepatitis C virus (HCV) cDNA inserts in clones K9-1 through 15e. It is antigenic and could be used in immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 GTRT1ASPKGPVIQMYINVDKDLVGWPAPQGSRSLTPCTCGSSDLYLVTRHADVIPVRRR 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense polynucleotide. The HCV is characterized by a positive stranded RNA genome which has allow homology at the polypeptide level to a HCV polyprotein. The antisense polynucleotide binds to cellular polynucleotides which chance and/or are required for viral infectivity, replicative ability, or chronicity. The antisense polynucleotides which designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises a agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MAPITAYAQQTRGLLGCIITSLTGKDKNQVEGEVQIVSTAAQTFLATCINGVCWTVYHGA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymerase chain reaction; PCR; amplify; primer; hepatitis C virus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polynuciotide which is complementary to or corresponds to a sense
strand of the virus genome, and selectively hybridises to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        99.0%; Score 943; DB 21; Length 2772; 98.4%; Pred. The polypeptides are used to diagnose HCV-induced NANBH. To raise antibodies for immunoassay or treatment, or to produce vaccines.

(N.B. This record was resubmitted to correct errors in the sequence.) (Updated on 25-MAR-2003 to correct PR [Held.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis C virus gene - used for prodo. of polypucleotide probos,
polypeptide(s) and antibodies for diagnosis, prevention and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the entire hepatitis C virus polyprotein. HCV is a member of the flavivirus family and appears to encode a basic polypeptide domain (°C") at the N-terminal of the virai polyprotein, followed by two giycoprotein domains ("El", "E2/NSI"), upstream of the nonstructural genes N2 through NS5.                                                                                                                                                                                                                                                                                                                                        AAR70230 is the composite hepatitis C virus (HC-JI/CDC/CHI) protein from which the synthetic HCV antigens described in AAR70310-R70229 were derived. These synthetic antigens can be used to screen blood, or blood products for the presence HCV, they can also be used in various specific assays for the detection of HCV antibodies, and

The invention provides two new isolates of hepatitis C virus (HCV). Ji and and J7. Those two isolates comprise nucleotide and arise acid sequences that are distinct from the HCV isolate MCV-1. The nucleotide sequences may be used to detect non-A. HCV (MANH) polynucleotides by hybridisation for diagnosis of NANH infections. They may also be used to screen blood donors, donated blood and blood products for this infection. The isolates may also be used to isolate other naturally occurring variants of the virus. The polypeptides may be used as a vaccine for variants of the virus. The polypeptides may be used as a vaccine for present sequence represents the unite against intection with NANHH. The present sequence represents the unite adding sequence of HCV-1 DFF. (Updated on 20-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This sequence is encoded by the genome of a blood transmissible non-A, non-B hepatilis (NAMBE) virus. The cDNA sequence was isolated using the primers given in AAG63500-35. The amplified fragments are used in the detection of hepatilis virus. The target DNA was isolated from serum of chronically infected NAMBH patients who were C100 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on cDNA and the total human NAMBH DNA was constructed from 23 clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the sequences given in AAR50068 and AAR50070-82 represent antigens of structural and non-structural regions of non A non B hepatitis virus (NANBHY). The CDNA encoding these sequences wase derived from the plasma of a NANBH patient by recombinant DNA techniques. These fragments are useful for the diagnosis of NANBH patients and the detection of NANBHY carriers.
                                                                                                                                                                                                                                                                   Gaps

The sequences given in AAR98361-62 response the 5'UTR/CCRE/ENV/NS1/NS2/NS3 protein region derived from hepatitis C virus (HCV) isolates #4 and #6 respectively. The proteins partic, contain amino acids 384-495 of the HCV NSI antiquen. These protein fragments may be used in the detection of antibodies against HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant polypeptide comprising partial NSI region of hepatitis
non-A non-B viral antigen - used in a method for detecting
antibodies against hepatitis non-A non-B virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HCV, infectious clone; infection; diagnosis; therapy; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Infectious nucleic acid sequences can also
                                                                                                                                                                                                                                                                                                                                                                                                             This protein is encoded by the infectious hepatitis C virus (HCV) genotype ib strain HC-J4 genome (see AAX2483). [G.-J4 was obtained from acute phase plasma of a chimparzee infected with serum containing HC-J4/91. The infectious nucleic acid sequence can be used to produce chimeric genomes (see AAX2483) consisting of the open reading frames of infectious nucleic acid sequences of other genotypes (including genotypes 1-6) and subtypes (such as lb. 2a, 2b, 2c, 3a, 4a-f, 5a and 6a) of HCV. The invention also relates to the introduction of mutations or deletions into infectious nucleic acid sequences in order to produce an attenuated HCV virus suitable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  be used to produce attenuated virus via passage in vitro or in vivo of the viruses produced by transfection of a host ceil with the infectious nucleic acid sequence. Vaccines comprising one or more polypeptides made from the infectious nucleic acid sequence are used to immunise mammals, especially humans, against hepatitis C. The nucleic acid sequences can also be used to induce protective immunity against the virus. The nucleic acid sequences or their encoded proteases (e.g. NR3 protease) can additionally be used to develop screening assays to identify antiviral agents for HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amino acid sequence of a hepatitis G virus (HCV) clone genetype (b.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a nucleic acid comprising a chimeric virus genome, specifically bevine viral diarrhoea virus (BVDV) genome in which the (non-)structural region has been replaced by the (non-)structural region of a hepatitis C virus (EVV) genome. The nucleic acids comprising the chimeric virus and the chimeric virus are useful for identifying the chimeric viruses, in screening for neutralizing antibodies to HCV of different genotypes, in the production of HCV-BVDV virions, for the development of inactivated or attended vaccines to prevent HCV-BVDV in amammal, in studying the molecular properties of HCV indirectly in virto, and in identifying inhibitors of viral enzyme activity which would be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            as antiviral agents. Formulations or compositions comprising the chimeric virions may be used to treat or prevent the signs and symptoms of HCV. The present sequence is encoded by a HCV clone, which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New infectious nucleic acids of the GB virus-B clone, useful for indirectly studying the molecular properties of hepatitis C virus (HCV) and in developing vaccines and therapeutics for HCV \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                         New nucleic acid comprising a chimeric bovine viral diarrhoea virus genome in which the (non-)structural region has been replaced by hepatitis C virus (HCV) genome useful for treating or preventing HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 41; DB 22; Length 3010; Pred. Constructs comprising an NS4 peptide requence covalently attached to the N-terminus of NS3 catalytic domain or their fragments and be used to create fusion polypeptides. This fusion polypeptide contains the NS3 domain expressed in a size, soluble form. This facilitates the use of the polypeptide in direct screen.ng of potential anti-viral compounds, that are used for diagnosts and treatment of hepatitis C virus infection. It is also used to seroen for inhibitors of serine protease activity. The polymucicotides are also useful to identify diagnostic or therapeutic compounds and for recombinant production of
                                                                                                                                                                                                                                                                                                                                                              NS3 catalytic domain: NS4A peptide: NS4A-NS2 fusion construct: diagnosis: serine protease; trypsin family; screening: anti-viral compound: treatment: inhibitor; therapeutic.

The invention describes crystallized complexes of HCV helicase and an oligocucleotide. The described method is used in a novel computer programme where the computer is programmed with the structure coordinates of the HCV helicase oligonucleotide binding pocket or the HCV holicase nucleotide triphosphate pocket wherein the computer is capable of displaying a three-dimensional representation of that

The sequences given in AAR29852-70 are encodeed by various clones which
                                                                                                                                                                                                                            CONA was prepared from HCV genomic RNA. Full-length close JK1-5 and 14 shorter closes were isolated by PCR amplification.
Primor/probes derived from the sequences of these clones can be used in diagnostic assays for HCV. See also AAQ40425-C40439.
                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Clone: polypeptide; NS2-NS4: Hepatitis C: Virus; HCV; serum; HC; transcriptase; cDNA; primer; allele.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New hepatitis C virus gene and its encoded protein - used for diagnosing and vaccinating against hepatitis C virus infections
                                                                                                                                                                                                                                                                                                                                                                   0;

A peptide comprising part of the amino acid sequence may be used as an antigen as part of a method of detection for human anti-HCV antibody or in diagnosis of human hepatitis C. It may also be used as an antigen in a method of prodon, of vaccine for human hepatitis C. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents an example of the above complex. The present NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors by Cheb protease activity, the helicase activity and the Afpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the HCD
Were used in the isolation of the NS2-NS4 regions of the Hepatitis C Virus (HCV) dene of the invention (see also AAR29660, AAR29559-60 and AAR29843-51). These NN sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into CDNA using transcriptase in the presence of one amplification from the serum of a AAR2576-79. The sequences were then amplified using primer pairs. The CDNA sequences isolated represent different alleles of the same region of the HCV dene. Sequence comparisons of these cromes showed that it is possible for a patient to carry more than one HCV strain at one time. See also AAR32436. (Updated on 25-MAR-2503 to correct PN field.)
                                                                                                                                                                                                                                                                                       or Saps

Infact, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Alpase activity of NS3. The covalent covalent protease premide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                         HCV: hepatitis C virus; single chain recombinant complex; linker; NS3 protease; NS4A cofactor; NS4A-NS3 complex; serine protease; hydrophobic domain; covalent complex; detection; inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4 serine protease domain, where the hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4 protease uchain. The present to the amino terminus of the HCV NS4 protease uchain. The present complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode or Ending of HCV intibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the holicase activity and the ATPASE activity of NS3. The covalent NS4A-NS3 complexes are mode activity and active are also be used for detecting inhibitors of the protease activity and the ATPASE activity of NS3. The covalent proteases activity and the atPase activity the file the non-covalent protease-poptide complexes previously available.
                                                                                                                    ECV: hepatitis C virus: single chair recombinant complex: lister:
NS3 protease; NS4a colactor: NS4a-NS3 complex: serine protease;
hydrophobic domain; covalent complex: detretion: inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 37: DB 20; Legath 216:

Virus Res. 23.39'55(1992).
Virus Res. 23.39'55(1992).

**PUNCTION: TIE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE NEWHRANE-RELATED FUNCTION.

**NS AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

**NS AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

**IT CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral procursor polyprotesin, commonly with Asp or Giu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

**POSITION.**CYS OF THE IN P1 and Ser or Ala in P1'.

**IT CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + ONTALYTIC ACTIVITY: N nucleoside triphosphate + ONTALYTIC ACTIVITY: N nucl

-!- SIMILARITY: Belongs to family T2R of G-prolein coupled receptors.
-!- COUTION: This protein was previously referred to T2RS, but due to its high similarity towards both the human and rat T2R9 sequences it is considered to be T2R9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SUBCELLULAR LOCATION: Integral membrane protein.

TISSUE SPECIFICITY: Expressed in subsets of taste receptor cells of the tonque and palate epithelium and exclusively in quistducinpositive cells. Expressed in quastric and duodenal tissues.

MISCELLANEOUS: Mast easte cells may be activated by a limited number of bitter compounds; individual taste cells can
                                                                                                                                                                                                                                                                                                                                                                                                                                       Adler E., Feng L., Guo W.,

J. Biol. Chem. 269:1995-2001(1994).

-!- FUNCTION: MAJOR GLYCOPROTED.
-!- FUNCTION: MAJOR GLYCOPROTED. OF ENDOTHELIUM. MAY FLAY A CRITICAL ROLE: IN THE BINJING OF ENDOTHELIAL CELLS TO INTEGRINS AND/OR OTHER RGD RECEPTORS.
-!- SUBUNII: HOMODIMER THAT FORMS AN HETEROMERIC COMPLEX WITH THE SIGNALING RECEPTORS FOR TRANSFORMING GROWTH FACTOR-BETA: TGF-BETA RECEPTORS I AND/OR II. IT IS ABLE TO BIND TGF-HETA 1, AND 3 EFFICIENTLY AND TGF-BETA 2 LESS EFFICIENTLY.
-!- SUBCELLULAR MOORTION: Type I membrane Protein.
-!- SUBCELLULAR MOORTION: Type I membrane Protein.
-!- SIMILARITY: SOME REGIONS OF SIMILARITY TO TGF-BETA RECEPTOR TYPE III (BETAGLYCAN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Endoglin forms a heteromeric complex with the signaling receptors
